1 Introduction

ENGEO (NZ) Ltd (ENGEO) was requested by Richard Peterson of Harrison Grierson, on behalf of Malcolm Gillies of Wallaceville Developments Ltd, to undertake a Detailed Environmental Site Investigation (DSI) at the Wallaceville site, immediately east of Trentham Racecourse in Upper Hutt (Figure 1 - herein referred to as "the site"). Details of this engagement with the client are outlined in our letter proposal reference P2014.001.457 dated 11 November 2014.

A Preliminary environmental Site Investigation (PSI) report was issued by Geoscience (now ENGEO) on 3 December 2014 which identified that a number of activities on the Hazardous Activities and Industries List (HAIL) had occurred on the site following its use as an AgResearch Institute. Previous investigations and remediation on the site had been undertaken by Tonkin and Taylor between 2003 and 2008.

This DSI was undertaken in accordance with Ministry for the Environment (MfE) 2011, Guidelines for Reporting on Contaminated Sites¹.

2 Site Description and Geology

The site is located immediately east of the Trentham Racecourse in a 'special activity' zoned area of Upper Hutt. The site is located approximately 1.7 km south east of the Hutt River and groundwater is likely to flow towards the Hutt River in a north westerly direction. The site is generally flat. The Upper Hutt foothills are located immediately south east of the site. The site elevation is approximately 25 m above sea level. An uncontrolled fill site is located immediately to the east of the racecourse which is not part of the proposed development.

The proposed development site covers seven legal boundaries with a combined area of 68,222 m², and is predominantly occupied by grassed areas, previously used for pastoral purposes associated with the AgResearch facility. Gravel roads are located throughout the site. Disused former office, campus and laboratory buildings are to the west of the site.

The site is bounded by the Wairarapa Railway Line (trending southwest to northeast) to the north, Ward Street (trending northwest to southeast) to the east, Trentham Racecourse to the west and Alexander Road to the south, which trends southwest to northeast (Figure 1).

The geological map² of the area indicates that the site is underlain by alluvium deposited by the Hutt River. A GNS Borehole in Trentham Memorial Park located 1.5 km northwest of the site indicates gravel and silt to at least 200 m depth. Groundwater levels have been measured at between 8.5 m and 10.2 m below existing ground level across the site.

¹ MfE 2011: Contaminated Land Management Guidelines No.1 : Reporting on Contaminated Sites in New Zealand

² Begg, J.G., Mazengarb, C., 1996. Geology of the Wellington Area, scale 1:50,000. Institute of Geological and Nuclear Sciences geological map 22. 1 sheet + 28p. Lower Hutt, New Zealand: Institute of Geological and Nuclear Sciences Limited

3 Site History

A number of sources of information were contacted for information relating to the site regarding its past and present uses and to identify any other environmental issues which may be on record. This included querying the Greater Wellington Regional Council (GWRC) Selected Land Use Register (SLUR) and reviewing records held by Upper Hutt City Council (UHCC) Archives including the property file. A review of a number of historic and current aerial photographs was also undertaken using images from New Zealand Aerial Mapping and Google Earth.

A review of historic aerial photographs from 1943 to 2008 indicates that the site has been used for pastoral purposes since at least the 1940s. Small square structures, however, indicate the site may have been used for munitions storage during and/or post-World War II.

For its more recent uses, the site appears on the Wellington Regional Council Selected Land Use Register (SLUR) as a site with a verified history of manufacturing and storage of chemicals, pesticides and animal pharmaceuticals during the site's history as an AgResearch Facility.

A detailed history of the site is summarised in Tables 3 to 6 of the Geoscience PSI and concluded that the following potentially hazardous former activities, as listed on the HAIL, had occurred on site:

- A1 – Agrichemicals including commercial premises used by spray contractors for filling, storing or washing out tanks for agrichemical application;
- A2 – Chemical manufacture, formulation or bulk storage;
- A3 – Commercial analytical laboratory sites;
- A8 – Livestock dip or spray race operations;
- A10 – Persistent pesticide bulk storage or use including sports turfs, market gardens, orchards, glass houses or spray sheds;
- A14 – Pharmaceutical manufacture including the commercial manufacture, blending, mixing or formulation of pharmaceuticals, including animal remedies or the manufacturing of illicit drugs with the potential for environmental discharges;
- A16 – Skin or wool processing including a tannery or fellmongery, or any other commercial facility for hide curing, drying, scouring or finishing or storing wool or leather products;
- A17 – Storage tanks or drums for fuel, chemical or liquid waste;
- F7 – Service stations including retail or commercial refuelling facilities; and
- G3 – Landfill sites.

A review of the previous investigations undertaken between 2003 and 2008 by Tonkin and Taylor was undertaken. Since their investigations, the National Environmental Standard (NES)³ legislation has been enforced (2012). Several soil samples, which were previously below residential guidelines, were identified as being above the current NES Residential Soil Contaminant Standards (SCSs). Figure 10 of the PSI report indicated the areas of concern which were identified for further investigation and is presented as Figure 2 in this report.

³ MfE, National Environmental Standard for Assessing and Managing Contaminants in Soil to Protect Human Health

4 Soil Contamination Investigation

4.1 Objectives

The objectives of the investigation were to determine:

- The type, extent and level of contamination within the areas of concern identified on site, as shown in Table 1 and Figure 2;
- Potential effects of contaminants on public health, the environment and structures;
- Disposal options for the soil that may be removed from site during development; and
- Whether the soils remaining on site are suitable for the proposed end use.

Table 1: Areas of concern assessed in this DSIR

Area Ref	Location	Contaminants of Concern (COC)	Reason
1	Stables - stabling and paddocks to the east of the racecourse	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides	No previous sampling undertaken (2 ha)
2	Paddock X	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides	No near surface sampling previously undertaken. Aerial photos on Google Earth since 2004 indicate stockpiles in some areas and disturbed ground (1 ha).
3	Paddock 39	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides	No testing previously undertaken in this area
4	Paddock 2	Arsenic and lead	To identify the vertical and lateral extents of the arsenic and lead contamination identified above the SCSs
5	Paddocks 70, 71 and extra 1	Lead	One previous composite sample was above lead SCS. Samples to pinpoint location of elevated lead

Area Ref	Location	Contaminants of Concern (COC)	Reason
6	Paddocks C3 and C4	Heavy Metals (including mercury boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides	Limited sampling undertaken previously
7	Former staff housing area	Heavy metals (including arsenic, cadmium, chromium, copper, nickel, lead and zinc) and polycyclic aromatic hydrocarbons (PAH)	Limited sampling undertaken previously
8	SABU building	Lead	Lead residues recorded above residential SCSs
9	Animal pens	Lead	Lead residues recorded above residential SCSs
10	ESAU, MU, EML (small animal unit, metabolism unit, electron microscope lab)	Lead	Lead residues recorded above residential SCSs
11	SS (solvent store and gas cylinder store)	Lead	Lead residues recorded above residential SCSs
12	Library	Lead	Samples below 300mm above SCS for lead
13	Histology	Arsenic and PAH	Arsenic at former incinerator above residential SCS
14	Carpenters	Lead	Lead residues recorded above residential SCSs
15	Caretaker	Lead	No testing previously undertaken
16	Farm Workshop	Arsenic	No testing previously undertaken

4.2 Scope of Work

To achieve the objectives, the following scope of work was undertaken:

- Collection of 209 near surface soil samples between 24 and 26 November 2014 from the locations indicated on the plans in Figure 2 and Appendix 1;
- Submission of all samples to Hill Laboratories to be tested individually, combined into composite samples or held in cold storage; and
- Issuing this Detailed Site Investigation Report.

4.3 Sampling Methodology

The following methodology was used for taking the samples:

- The majority of samples were taken using a hand auger or a stainless steel trowel;
- The hand auger/trowel were decontaminated before each sample was taken using a triple wash method with Decon90, tap water and de-ionised water;
- Each soil sample was inspected for visual and olfactory indicators of contamination; and
- Each sample was placed into a laboratory supplied sample container, which in turn was placed directly into chilled storage for transport.

4.4 Sample Nomenclature

Table 2 shows the sample nomenclature chosen to distinguish the samples from the various areas. All samples tested were taken from a depth of 0.1 m below existing ground level except for the samples at the library building (L1 to L6) which were taken from 0.4 m depth.

Table 2: Sample Nomenclature

Location	Sample Names	Number of Samples	Tested as Composite Samples?	Contaminants of Concern (COC)
Stables - stabling and paddocks to the east of the racecourse	ST1 to ST31	31	✓	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides
Paddock X	PX.1 to PX.20	20	X	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides

Location	Sample Names	Number of Samples	Tested as Composite Samples?	Contaminants of Concern (COC)
Paddock 39	P39.1 to P39.3	3	X	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides
Paddock 2	P2.1 to P2.6	6	X	Arsenic and lead
Paddock 70	P70.1 to P70.5	5	X	Lead
Paddock 71	P71.1 to P71.5	5	X	Lead
Extra 1	X1.1 and X1.2	2	X	Lead
Paddocks C3 and C4	C3/C4.1 to C3/C4.8	8	✓	Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides
Former staff housing area	FH1 to FH16	16	✓	Heavy metals (including arsenic, cadmium, chromium, copper, nickel, lead and zinc) and polycyclic aromatic hydrocarbons (PAH)
SABU building	SABU1 to SABU8	8	X	Lead
Animal pens	AP1 to AP4	4	X	Lead
ESAU (small animal unit)	ESAU1 to ESAU6	6	X	Lead
MU (metabolism unit)	MU1 to MU3	3	X	Lead
EML (electron microscope lab)	EML1 to EML3	3	X	Lead
SS (solvent store and gas cylinder store)	SS1 to SS4	4	X	Lead
Library	L1 to L6	6	X	Lead
Histology	H1 to H5	5	X	Arsenic and PAH

Location	Sample Names	Number of Samples	Tested as Composite Samples?	Contaminants of Concern (COC)
Carpenters	CARP1 to CARP6	6	X	Lead
Caretaker	C1 to C4	4	✓	Lead
Farm Workshop	FW1 to FW4	4	✓	Arsenic

4.5 Soil Testing

The soil samples were tested for the COCs from each area as described in Table 2. The sample locations are shown on the sample location plans in Appendix 1.

4.6 Quality Assurance and Quality Control

The quality assurance / quality control (QA / QC) procedures undertaken during the works included:

- The use of standard sample registers and chain of custody records for all samples;
- Each soil sample was given a unique identification number, which consisted of a sample location identifier (e.g. S1) and the sample depth, where relevant;
- The hand auger and trowel were decontaminated before each sample was taken using a triple-wash technique;
- The excavator machine bucket was scraped and any excess soil brushed off after each sample was taken and new samples were collected from the undisturbed soil in the centre of the bucket; and
- Hill Laboratories is an International Accredited and New Zealand (IANZ) Accredited laboratory and were engaged to conduct all laboratory analysis. To maintain their International Accreditation, Hills undertakes rigorous cross checking and routine duplicate sampling testing to ensure the accuracy of their results.

4.7 Investigation Guidelines

The following guidelines have been selected for the analysis of the results:

- National Environmental Standard for Assessing and Managing Contaminants in Soil to Protect Human Health⁴ (NES);
- Ministry for the Environment, 1999, Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand Revised 2011 (MfE1999);
- Waste Acceptance Guidelines, Silverstream Landfill⁵;
- Hazardous Waste Guidelines⁶; and

⁴ Ministry for the Environment (2012) *Users' Guide: National Environmental Standard for Assessing and Managing Contaminants in Soil to Protect Human Health*

⁵ As supplied by Penny Kneebone, Tonkin and Taylor, November 2013.

- Background soil concentrations for the Wellington Region.⁷

The site's proposed land use is predominantly residential, with some high density residential and commercial areas. For the majority of the site, the Soil Contaminant Standards for Health for Residential (10% produce ingestion), High Density Residential and Commercial/Industrial outdoor workers has been used for the proposed land use and for protection of the workers during the site development. The Guidelines for Managing Total Petroleum Hydrocarbons (TPHs) in residential and commercial/industrial sectors has also been used to reflect the future site use and protection of workers.

As outlined in the MfE Contaminated Land Management Guidelines No. 5 - Site Investigation and Analysis of Soils⁸, guideline values have been adjusted to take account of the potential dilution of contaminants in composite samples. In this instance, the composite samples consisted of between two and four sub-samples, therefore the original guideline criteria were divided by either two, three or four, depending on the number of sub-samples.

The results of the analysis were also compared to the Silverstream Landfill waste acceptance guidelines, and the Ministry for the Environment Hazardous Waste Guidelines, to give disposal options, during the redevelopment.

5 Results

5.1 Surface Soil Encountered

The soils encountered during the investigation generally consisted of silt, sand or silt/sand mixtures. The soil encountered in Paddock 2 was gravel fill. Stockpiles of soil were observed on the western side of the former housing area.

5.2 Sample Results

A summary of all the results from the laboratory analyses, compared with the relevant guidelines (the NES, MfE 1999, background soil concentrations, and other international risk based guidelines, where no New Zealand guidelines exist, in accordance with MfE 2011: Contaminated Land Management Guidelines No.5) are included in Appendix 2.

The raw laboratory results are presented in Appendix 3.

After the initial results were analysed, further testing was undertaken on six of the individual samples that comprised the composite samples tested. This was done as the results of six of the composite samples were above the adjusted guideline values. These samples were from the following locations:

- FH1-4, FH5-8 in the former staff housing area (arsenic and lead);
- FH9-12 in the former staff housing area (arsenic);

⁶ Ministry for the Environment. 2004. *Hazardous Waste Guidelines Module 2. Landfill Waste Acceptance Criteria and Landfill Classification*

⁷ URS, 2003, *Determination of Common Pollutant Background Soil Concentrations for the Wellington Region*, prepared for Greater Wellington Regional Council

⁸ MfE. 2011. Contaminated Land Management Guidelines No. 5, Site Investigation and Analysis of Soils

- FH13-16 in the former staff housing area (arsenic)
- FW1-4 behind the farm workshop (arsenic);
- ST28-31 in the stables area (arsenic); and,
- C1-C4 around the caretakers building (lead).

5.2.1 Residential (10% produce) Results

Tables 3 and 4 give the results of the soil samples which exceeded the relevant NES SCSs. Table 3 gives the composite results exceeding the adjusted SCSs for residential use. The individual sub-samples were subsequently tested and the results of all individual samples exceeding the SCSs, are given in Table 4.

Table 3: Summary of composite results compared to the Residential (10% Produce) SCSs

Location	Sample Reference	Analyte	Result (mg/kg)	Adjusted NES SCSs – Residential use (mg/kg)	Comment
Stables, composite	St28, St29, St30, St31	Arsenic	7	5	All individual sample results subsequently tested below SCS for Arsenic
Farm Workshop, composite	FW1, FW2, FW3, FW4	Arsenic	7	5	All individual sample results subsequently tested below SCS for Arsenic
Caretakers, composite	C1, C2, C3, C4	Lead	70	52.5	All individual sample results subsequently tested below SCS for Lead
	FH1, FH2, FH3, FH4		57		2 samples above SCS (see Table 4)
	FH5, FH6, FH7, FH8		12		1 sample above SCS(see Table 4)
Former Housing, composite	FH9, FH10, FH11, FH12	Arsenic	6	5	All individual sample results subsequently tested below SCS for Arsenic
	FH13, FH14, FH15, FH16		6		1 sample above SCS(see Table 4)
	FH1, FH2, FH3, FH4	Lead	94	52.5	All individual sample results subsequently tested below SCS for Lead
	FH5, FH6, FH7, FH8		57		All individual sample results subsequently tested below SCS for Lead

Table 4: Summary of individual results compared to the Residential (10% Produce) SCSs

Location	Sample Reference	Analyte	Result (mg/kg)	NES Soil Contaminant Standards – Residential use (mg/kg)	Comment
Paddock 2	P2.3		25		
	P2.5	Arsenic	25	20	Further assessment/remediation required
	FH1		200		
	FH4	Arsenic	26	20	
	FH5		36		
	FH14		21		

Table 4 indicates that of all the samples taken, six samples exceed the SCS for residential use for Arsenic.

5.2.2 High Density Residential Results

Of all the soil samples tested, only one of the samples (FH1) at the former housing area exceeded the SCS for arsenic (see tables in Appendix 2). The arsenic result from that sample was 200 mg/kg, compared to the High Density Residential SCS of 45 mg/kg.

5.2.3 Commercial/Industrial Results

Of all the soil samples tested, only one of the samples (FH1) at the former housing area exceeded the SCS for arsenic (see tables in Appendix 2). The arsenic result from that sample was 200 mg/kg, compared to the Commercial/Industrial SCS of 70 mg/kg.

5.2.4 Background Soil Concentration Results

Eighty of the sample results from the site are above the background soil concentrations for the Wellington Region for one, or more, analytes (see tables in Appendix 2).

5.2.5 Landfill Disposal Results

The results have been compared to the waste acceptance criteria for the Class A Silverstream Landfill and the more stringent Class B Landfill (see tables in Appendix 2). As eighty of the sample results are above the background concentrations for the Wellington Region, the soil is not generally suitable to be disposed of as cleanfill. All of the samples that were tested for a full suite of heavy metals returned results above the Class B Landfill acceptance criteria. Only ten of the samples tested returned results above the Silverstream Landfill soil screening acceptance criteria. Therefore, it is considered that the majority of the soil on site could be disposed of to Silverstream Landfill. This should be confirmed with the Landfill operator, who is likely to require further soil testing in some areas.

6 Conceptual Site Model

A contamination conceptual site model consists of three primary components to allow the potential for risk to be determined, these are:

- Source of contamination;
- Pathway to allow the contamination to mobilise; and
- Sensitive receptors which may be impacted by the contamination.

Diagram 1: Pathways by which Contaminants in Soil Can Affect Human Health

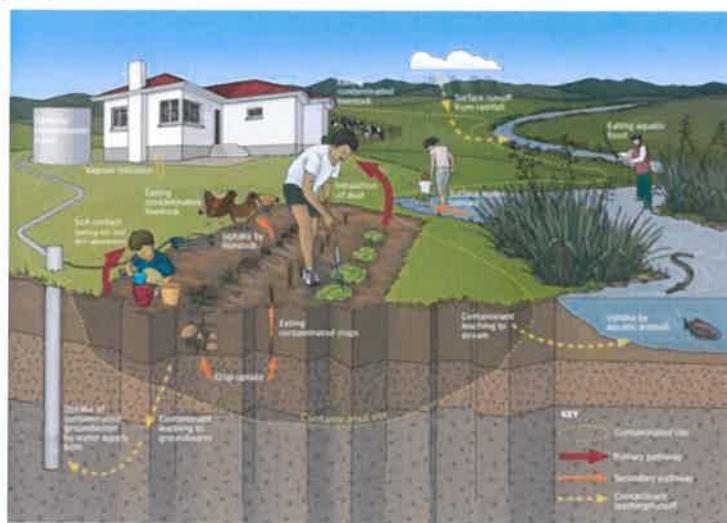

Table 5: Conceptual Site Model

Source	Pathway	Receptor
Soil impacted by Heavy Metals (including mercury, boron, arsenic, cadmium, cobalt, chromium, copper, nickel, lead and zinc), Organochlorine, Organonitrogen and organophosphorus pesticides ,TPH and PAH	Direct contact (dermal absorption) Ingestion (either of soil or produce grown in the soil) Inhalation (dust) Stormwater run-off	Site development workers Future site users Future maintenance / excavation workers Surrounding environment Local surface water receptors Council owned stormwater infrastructure
Risk of Contamination	Site End Users: Moderate – five of the soil samples were found to have levels of arsenic which exceeded the Residential use soil contaminant standards.	

Source	Pathway	Receptor
Site Development Workers and Future Maintenance/Excavation Workers:		
Low – Only one of the soil samples was found to have levels of arsenic which were above the commercial/industrial soil contaminant standard which can be applied to these workers.		
Surrounding Environment:		
Low - In general, the results of the soil samples across the site were found to contain low levels of contamination.		

7 Conclusions and Recommendations

A Preliminary environmental Site Investigation (PSI) report was issued by Geoscience (now ENGEO) on 3 December 2014 which identified that a number of activities on the Hazardous Activities and Industries List (HAIL) had occurred on the site following its use as an AgResearch Institute.

Previous investigations and remediation on the site had been undertaken by Tonkin and Taylor between 2003 and 2008. However, since their investigations, the National Environmental Standard (NES)⁹ legislation has been enforced (2012). Several soil samples which were previously below residential guidelines were identified as being above the current NES Residential Soil Contaminant Standards (SCSs). A number of areas (Figure 2) were identified as requiring further investigation and for this DSI, soil samples were tested for the COCs from each area as described in Table 2.

The results of the testing indicate that:

- Six samples from the former housing area and Paddock 2 exceed the SCS for residential use for arsenic;
- One sample from the former housing area exceeds the SCS for high density residential use for arsenic;
- One sample from the former housing area exceeds the SCS for commercial/industrial use for arsenic; and
- Eighty of the sample results from the site are above the background soil concentrations for the Wellington Region for one or more analytes.

It is considered that the majority of the soil on site could be disposed of to Silverstream Landfill. This should be confirmed with the Landfill operator, who is likely to require further soil testing in some areas

Table 6 summarises the areas investigated and their suitability for future use.

⁹ MfE, National Environmental Standard for Assessing and Managing Contaminants in Soil to Protect Human Health

Table 6: Suitability for future use

Area Ref	Location	Suitability – future use

16	Farm Workshop	✓	✓	✓	NA

Notes:

NA = area not considered for recreational use

Based on the soil sample results, the areas tested are generally suitable for future residential site use.

Four sample results from the area of former housing, and two sample results from Paddock 2, indicate levels of arsenic above the residential SCS. The soil in these areas will require further assessment and remediation before development into residential use.

The following options may be considered:

- **Option 1:** Further sampling and testing in the areas where elevated results were identified to determine the vertical and lateral extent of the contamination required to be removed. This may involve several rounds of sampling and testing to determine the extents. Remediation would comprise removal and disposal of the previously delineated contaminated soils. Validation testing of the remaining soils would be required to confirm suitability for residential use.
- **Option 2:** Use of an X-Ray Fluorescence Analyser to determine the extent of contamination at the site. This would comprise sampling and testing a limited number of samples around the areas of the exceedances using both laboratory testing and XRF testing to calibrate the XRF. The XRF would then be used on-site during remediation and soil removal to confirm the volumes required to be removed and delineate the extent of the contamination. Validation testing of the remaining soils would be required to confirm suitability for residential use.
- **Option 3:** Earmark the areas exceeding the Residential SCSs (Paddock 2 and former Housing areas) for a less stringent future land use, i.e. High Density Residential or Commercial/Industrial. Only one result exceeded the SCSs for these land uses (FH1) and further assessment may result in no remediation being required.

For Options 1 and 2, any soil to be removed from site will be required to be disposed of at a suitably licensed Landfill. From the results obtained, it is considered that the soil is likely to be able to be disposed of at Silverstream Landfill. We would recommend that all soil to be removed from site is stockpiled and tested to confirm disposal options during site remediation.

It is recommended that the existing groundwater monitoring boreholes located around the non-engineered fill site are tested for the presence of ground gas to assess the potential for ground gas migration to the surrounding development areas.

8 Limitations

- i. We have prepared this report in accordance with the brief as provided. This report has been prepared for the use of our client, Wallaceville Developments Limited, their professional advisers and the relevant Territorial Authorities in relation to the specified project brief described in this report. No liability is accepted for the use of any part of the report for any other purpose or by any other person or entity.
- ii. The recommendations in this report are based on the ground conditions indicated from published sources, site inspections and subsurface investigations described in this report based on accepted normal methods of site investigations. Only a limited amount of information has been collected to meet the specific financial and technical requirements of the Client's brief and this report does not purport to completely describe all the site characteristics and properties. The nature and continuity of the ground between test locations has been inferred using experience and judgement and it must be appreciated that actual conditions could vary from the assumed model.

- iii. Subsurface conditions relevant to construction works should be assessed by contractors who can make their own interpretation of the factual data provided. They should perform any additional tests as necessary for their own purposes.
- iv. This Limitation should be read in conjunction with the IPENZ/ACENZ Standard Terms of Engagement.
- v. This report is not to be reproduced either wholly or in part without our prior written permission.

We trust that this information meets your current requirements. Please do not hesitate to contact the undersigned on 04 4720820 if you require any further information.

Analyst's Comments

It has been noted that the method performance for iprodione for ONOP analysis is not acceptable therefore we are unable to report this compound at this present time.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil	Method Description	Default Detection Limit	Sample No
Environmental Solids Sample Preparation	Air dried at 35°C and sieved. <2mm fraction. Used for sample preparation. May contain a residual moisture content of 2-5%.	-	1-40, 44-53
Heavy metals, screen As,Cd,Cr,Cu,Ni,Pb,Zn,Hg	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion, ICP-MS, screen level.	0.10 - 4 mg/kg dry wt	53
Organochlorine/nitro&phosphorus Pest.s Screen in Soils, GCMS	Sonication extraction, Dilution cleanup, GC-MS analysis. Tested on as received sample	-	53
Polycyclic Aromatic Hydrocarbons Screening in Soil	Sonication extraction, Dilution or SPE cleanup (if required), GC-MS SIM analysis (modified US EPA 8270). Tested on as received sample. [KBIs:5786,2805,2695]	0.010 - 0.05 mg/kg dry wt	22-26
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry) , gravimetry. US EPA 3550. (Free water removed before analysis).	0.10 g/100g as rcvd	22-26, 53
Total Recoverable digestion	Nitric / hydrochloric acid digestion. US EPA 200.2.	-	1-40, 44-53
Composite Environmental Solid Samples*	Individual sample fractions mixed together to form a composite fraction.	-	7-10, 31-34, 41-43
Total Recoverable Arsenic	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	2 mg/kg dry wt	22-26, 31-34, 52
Total Recoverable Boron	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	20 mg/kg dry wt	53
Total Recoverable Cobalt	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	53

Sample Type: Soil

Test	Method Description	Default Detection Limit	Sample No
Total Recoverable Lead	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	1-21, 27-30, 35-40, 44-51

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.

Analyst's Comments

It has been noted that the method performance for Iprodione for ONOP analysis is not acceptable therefore we are unable to report this compound at this present time.

#1 It should be noted that the replicate analyses performed on this sample as part of our in-house Quality Assurance procedures showed greater variation than would normally be expected. This may reflect the heterogeneity of the sample.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil	Method Description	Default Detection Limit	Sample No
Environmental Solids Sample Preparation	Air dried at 35°C and sieved, <2mm fraction. Used for sample preparation. May contain a residual moisture content of 2-5%.	-	26-87
Heavy metals, screen As,Cd,Cr,Cu,Ni,Pb,Zn,Hg	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion, ICP-MS, screen level.	0.10 - 4 mg/kg dry wt	53-69, 77-83
Heavy metal screen level As,Cd,Cr,Cu,Ni,Pb,Zn	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion, ICP-MS, screen level.	0.10 - 4 mg/kg dry wt	84-87
Organochlorine/nitro&phosphorus Pest.s Screen in Soils, GCMS	Sonication extraction. Dilution cleanup, GC-MS analysis. Tested on as received sample	-	53-69, 77-83
Polycyclic Aromatic Hydrocarbons Screening in Soil	Sonication extraction, Dilution or SPE cleanup (if required), GC-MS SIM analysis (modified US EPA 8270). Tested on as received sample. [KBIs:5786,2805,2695]	0.010 - 0.05 mg/kg dry wt	37-44, 49-52, 84-87
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry) , gravimetry. US EPA 3550. (Free water removed before analysis).	0.10 g/100g as rcvd	37-44, 49-69, 77-87
Total Recoverable digestion	Nitric / hydrochloric acid digestion. US EPA 200.2.	-	26-87
Composite Environmental Solid Samples*	Individual sample fractions mixed together to form a composite fraction.	-	1-25, 37-52
Total Recoverable Arsenic	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	2 mg/kg dry wt	37-52
Total Recoverable Boron	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	20 mg/kg dry wt	53-69, 77-83
Total Recoverable Cobalt	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	53-69, 77-83

Sample Type: Soil

Test	Method Description	Default Detection Limit	Sample No
Total Recoverable Lead	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	26-44, 70-76

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.

**Analyst's Comments**

It has been noted that the spikes for ONOP on sample 1357128.87 was run as part of our in-house QC procedure, had lower than expected recoveries for Fenpropimorph and Chlorfluazuron. Therefore the results may be underestimated.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil

Test	Method Description	Default Detection Limit	Sample No
Environmental Solids Sample Preparation	Air dried at 35°C and sieved, <2mm fraction. Used for sample preparation. May contain a residual moisture content of 2-5%.	-	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 69-71, 74-87
Heavy metals, screen As,Cd,Cr,Cu,Ni,Pb,Zn,Hg	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion, ICP-MS, screen level.	0.10 - 4 mg/kg dry wt	69-71, 84-87
Heavy metal screen level As,Cd,Cr,Cu,Ni,Pb,Zn	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion, ICP-MS, screen level.	0.10 - 4 mg/kg dry wt	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57,
Organochlorine/nitro&phosphorus Pest.s Screen in Soils, GCMS	Sonication extraction, Dilution cleanup, GC-MS analysis. Tested on as received sample	-	59 69-71, 84-87
Total Petroleum Hydrocarbons in Soil	Sonication extraction in DCM, Silica cleanup, GC-FID analysis US EPA 8015B/MfE Petroleum Industry Guidelines. Tested on as received sample [KBIs:5786,2805,10734]	6 - 60 mg/kg dry wt	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59

Sample Type: Soil			
Test	Method Description	Default Detection Limit	Sample No
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry), gravimetry. US EPA 3550. (Free water removed before analysis).	0.10 g/100g as rcvd	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 69-71, 84-87
Total Recoverable digestion	Nitric / hydrochloric acid digestion. US EPA 200.2.	-	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 69-71, 74-87
Composite Environmental Solid Samples*	Individual sample fractions mixed together to form a composite fraction.	-	61-68, 72-77
Total Recoverable Arsenic	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	2 mg/kg dry wt	74-83
Total Recoverable Boron	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	20 mg/kg dry wt	69-71, 84-87
Total Recoverable Cobalt	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	69-71, 84-87
Total Recoverable Lead	Dried sample, sieved as specified (if required). Nitric/Hydrochloric acid digestion, ICP-MS, screen level. US EPA 200.2.	0.4 mg/kg dry wt	78-83

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.
